Adobe Premiere Pro Tutorial 3- Creating a title page, adding effects, and exporting

1. Open Adobe Premiere Pro and begin by creating the title page. First, shift the contents in the timeline panel by dragging it across the timeline. Then add the background you want to use as the title page.
2. Use the Ripple Delete function to move the other clips back into position by right clicking and drag the audio so that it matches the new length of the clip.
3. Next, add the name of the video to the title page. Go to the graphics panel and select browse. Then add the Basic Title by dragging it onto the timeline. Edit the text to “Butterfly Garden” by double clicking.
4. Next edit the font, size, and color. Go to the Essential Graphics panel and select Edit. Now reselect the title and scroll down to Text. Here we can change the font, style, and size.

5. To change the color, look beneath the text section to the appearance section. Click fill. Here change the color by using the toggle to select a base color and then the gradient to select which shade.
6. Now add audio and video effects. Begin by adding a video of a butterfly against a green screen in the V3 tract. After changing the length of it to fit the length of my title screen, adjust its size. To do this, right click on the clip in the timeline and select Set to Frame Size.
7. To get rid of the green screen, open the Effects panel. Type Ultra Key in the search bar and drag the effect to clip of the butterfly. Next go to the Effects Control Panel. Select the dropper and select the green screen. This will make it so that it disappears while the butterfly remains in place.
8. Next add effects to our audio so that it fades in and out when the video plays. Go back to the Effects panel and select Audio Transitions. Choose Crossfade and then Exponential Fade. Drag this to the beginning and end of the audio clip.
9. Now we can export our finished video. Select File, Export, and Media. The Export settings screen will appear. Edit the format to read H.264, the Preset to High Quality 720p HD, and change the Output name and location of where the video saves. Select Export and an MP4 of your video will be created.
